TOMIWA RICHARD ADESUGBA

Data Analytics • SQL • Python • Power BI

Lagos, Nigeria | 09169356588 | tomiwarichard61@gmail.com | LinkedIn | GitHub

PROFESSIONAL SUMMARY

Aspiring data analyst with hands-on, self-directed experience in SQL, Python, and Power BI, built through independently completed end-to-end analytics projects. Skilled in structuring relational databases, validating findings with statistical testing rather than assuming visual patterns are meaningful, and communicating insights through interactive dashboards. Comfortable across the full pipeline, from raw data cleaning to business recommendations.

TECHNICAL SKILLS

Databases & SQL: MySQL — joins, subqueries, CTEs, window functions, schema design (DDL), constraints, insert/upsert logic

Programming: Python (Pandas, SciPy, Matplotlib, Seaborn, Object-Oriented Programming), BeautifulSoup

BI & Spreadsheets: Power BI (interactive dashboards), Excel (PivotTables, Power Pivot, VLOOKUP, XLOOKUP, data cleaning)

Statistical Analysis: Hypothesis testing (t-tests, chi-square), correlation analysis, multiple-comparison correction

Version Control: Git & GitHub

PROJECTS

Marketing Campaign Effectiveness & Customer Segmentation Analysis | *Python, Pandas* | View Repository

- Cleaned a customer marketing dataset by removing missing-income records and clear outliers (a 1893 birth year and a 666,666 income value) and dropping uninformative columns before analysis.
- Found that income correlated far more strongly with customer spending (r = 0.79) than age (r = 0.12), with wine and meat accounting for about 78% of revenue, supporting value-based customer segmentation.
- Compared campaign response, finding 15.05% acceptance on the latest campaign versus 1.36% on Campaign 2, and recommended reviewing audience and offer before reallocating budget since acceptance alone does not prove incremental sales.

HR Attrition Analysis | *SQL, Python* | View Repository

- Queried and joined multi-table employee, department, and salary-history data using SQL (CTEs, window functions) to structure a full attrition investigation.
- Applied chi-square and t-test hypothesis testing with Bonferroni correction across four significance tests, correctly overturning an apparent department-attrition relationship (p = 0.65) that a surface-level comparison would have misread as meaningful.
- Identified employee tenure as the strongest predictor of attrition (p < .001), ahead of performance rating and compensation, and visualized findings using Seaborn/Matplotlib.

Olist E-Commerce Performance Analysis | *SQL, Python, Excel, Power BI* | View Repository

- Cleaned and merged 9 datasets covering 99,441 e-commerce orders, engineering 6 new features including delivery delay and per-order revenue.
- Found that late deliveries (6.6% of orders) nearly halved customer satisfaction, with average review scores falling from 4.21 to 2.27.
- Built a multi-page Power BI dashboard and Excel-based dashboard, delivering a stakeholder-facing business case report that flagged a R$9.91M revenue concentration (62.5%) across three states.

EDUCATION

SMA College, Lagos — Senior Secondary School Certificate (2025)
